min	3.070000	1.000000	1.000000
25%	13.347500	2.000000	2.000000
50%	17.795000	2.900000	2.000000
75%	24.127500	3.562500	3.000000
max	50.810000	10.000000	6.000000

```
a=pd.DataFrame(df1['day'].value_counts())
a.reset_index(inplace=True)
plt.bar(a['index'],a['day'])
```

<BarContainer object of 4 artists>

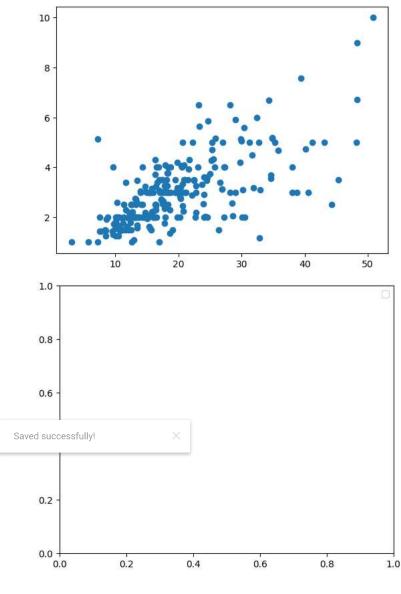

```
plt.scatter(df1['total_bill'],df1['tip'])
plt.show()
```

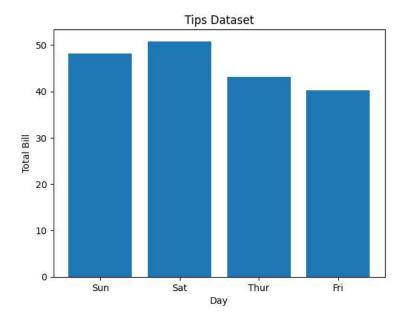

```
plt.scatter(x='total_bill',y='tip',data=df1)
fig=plt.figure(figsize=(5,4))
ax=fig.add_axes([1,1,1,1])
```

```
ax.legend(labels=('sun','mon','tue'))
plt.show()
```

```
#Different types of Matplotlib Plots
#bar chart
import matplotlib.pyplot as plt
import pandas as pd
# Reading the tips.csv file
data = pd.read_csv('/content/drive/MyDrive/Colab Notebooks/tips.csv')
# initializing the data
x = data['day']
y = data['total_bill']
# plotting the data
plt.bar(x, y)
# Adding title to the plot
plt.title("Tips Dataset")
# Adding label on the y-axis
plt.ylabel('Total Bill')
# Adding label on the x-axis
plt.xlabel('Day')
plt.show()
```

Customization that is available for the Bar Chart -

color: For the bar faces

edgecolor: Color of edges of the bar

linewidth: Width of the bar edges

import matplotlib.pyplot as plt

width: Width of the bar

Histogram A histogram is basically used to represent data provided in a form of some groups. It is a type of bar plot where the X-axis represents the bin ranges while the Y-axis gives information about frequency. The hist() function is used to compute and create histogram of x.

```
import matplotlib.pyplot as plt
import pandas as pd
```

```
# initializing the data
x = data['total_bill']

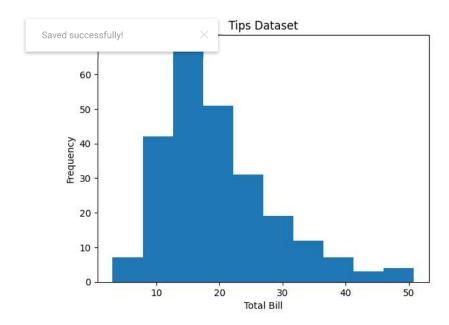

# plotting the data
plt.hist(x)

# Adding title to the plot
plt.title("Tips Dataset")

# Adding label on the y-axis
plt.ylabel('Frequency')

# Adding label on the x-axis
plt.xlabel('Total Bill')

plt.show()
```

Customization that is available for the Histogram –

import matplotlib.pyplot as plt

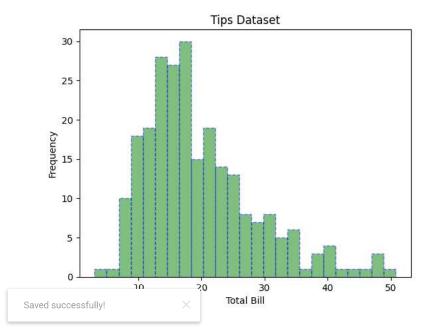

bins: Number of equal-width bins color: For changing the face color edgecolor: Color of the edges linestyle: For the edgelines alpha: blending value, between 0 (transparent) and 1 (opaque)

```
import pandas as pd

# initializing the data
x = data['total_bill']

# plotting the data
plt.hist(x, bins=25, color='green', edgecolor='blue',
```

```
linestyle='--', alpha=0.5)
# Adding title to the plot
plt.title("Tips Dataset")
# Adding label on the y-axis
plt.ylabel('Frequency')
# Adding label on the x-axis
plt.xlabel('Total Bill')
plt.show()
```

Scatter Plot Scatter plots are used to observe relationships between variables. The scatter() method in the matplotlib library is used to draw a scatter plot.

```
import matplotlib.pyplot as plt
import pandas as pd

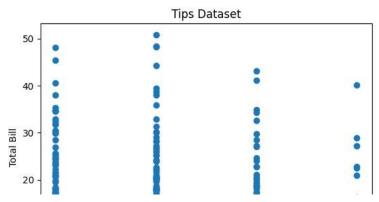

# initializing the data
x = data['day']
y = data['total_bill']

# plotting the data
plt.scatter(x, y)

# Adding title to the plot
plt.title("Tips Dataset")

# Adding label on the y-axis
plt.ylabel('Total Bill')

# Adding label on the x-axis
plt.xlabel('Day')
plt.show()
```

Customizations that are available for the scatter plot are -

s: marker size (can be scalar or array of size equal to size of x or y)

c: color of sequence of colors for markers

marker: marker style

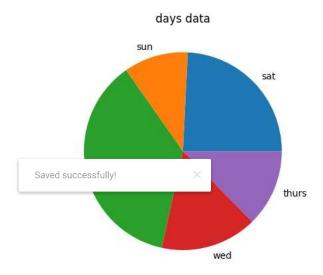

plt.show()

linewidths: width of marker border edgecolor: marker border color

alpha: blending value, between 0 (transparent) and 1 (opaque)

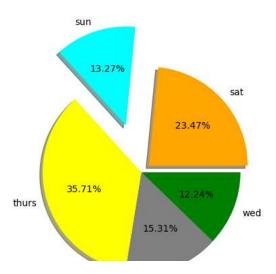

Tine Datacet

Pie Chart Pie chart is a circular chart used to display only one series of data. The area of slices of the pie represents the percentage of the parts of the data. The slices of pie are called wedges. It can be created using the pie() method.

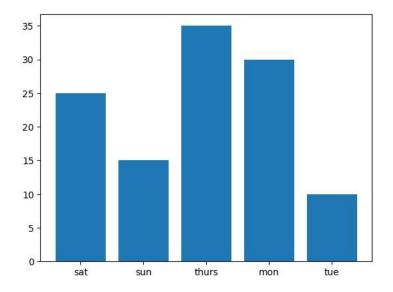

Customizations that are available for the Pie chart are -

explode: Moving the wedges of the plot autopct: Label the wedge with their numerical value. color: Attribute is used to provide color to the wedges. shadow: Used to create shadow of wedge.

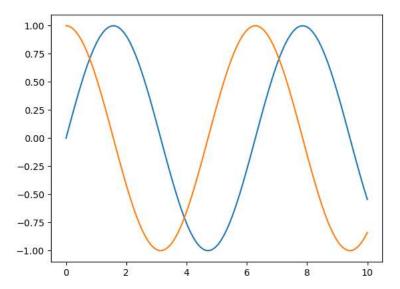

## → Saving a Plot

For saving a plot in a file on storage disk, savefig() method is used. A file can be saved in many formats like .png, .jpg, .pdf, etc.

```
x = np.linspace(0,10,100)
fig = plt.figure()
plt.plot(x,np.sin(x))
plt.plot(x,np.cos(x))
fig.savefig('Graph1.png')
```
